PROJECT PRESENTATION

Asset Lifecycle Management System

A cloud application for traceable institutional asset governance

Sandeep K · Rajalakshmi Engineering College · 2026–2027

THE OPERATING GAP

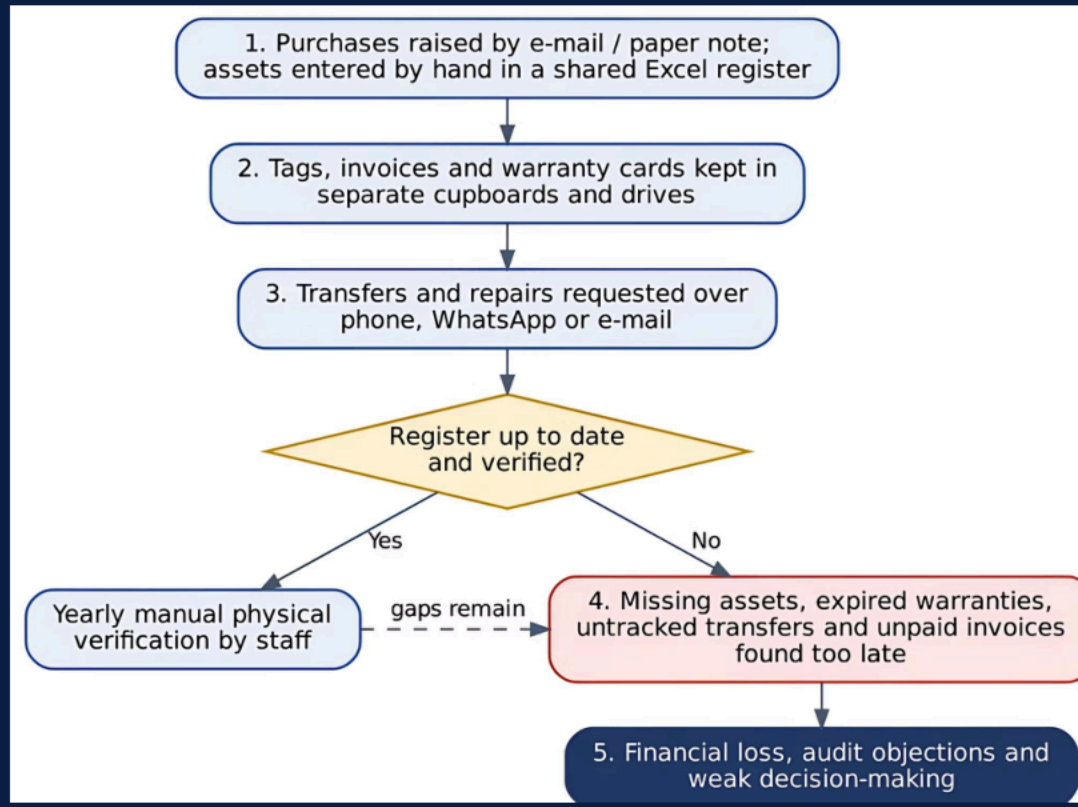

Manual tracking breaks the chain of accountability

Records are scattered

Purchases, warranty cards, repairs and transfers live in separate spreadsheets, emails and paper files.

Accountability breaks

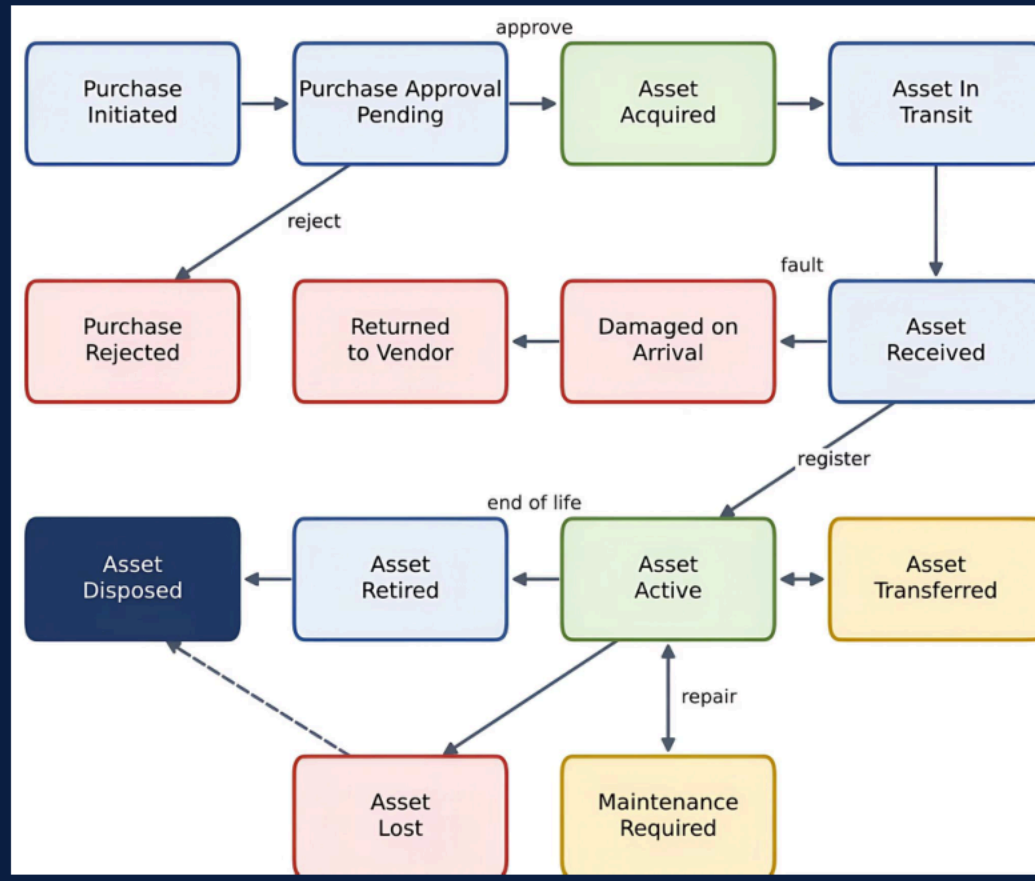

The result: missing assets, expired warranties, unowned critical faults and weak audit visibility.

THE FULL JOURNEY

One cloud application covers the full asset journey

1. Plan and purchase
2. Receive, register and assign
3. Maintain, transfer and audit
4. Retire and dispose

Zoho Creator brings these stages together with relational data, automated rules and role-specific access.

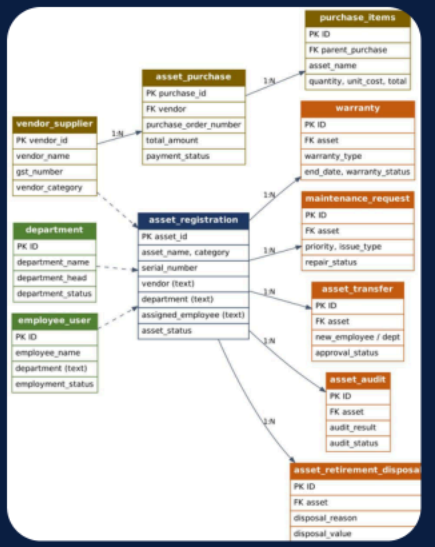

RELATIONAL FOUNDATION

Relational design creates a single source of truth

11 connected forms cover vendors, purchases, assets, warranties, maintenance, transfers, audits and disposal.

7 lookup fields connect lifecycle records to the asset, vendor or purchase record.

The asset register is the anchor for ownership, location, cost and status history.

CONTROL LOGIC

Automation turns policy into guardrails

1

Validate

Critical maintenance requests require an assigned technician.

2

Notify

Asset assignment triggers an email to the employee.

3

Timestamp

Completed repairs receive an automatic completion date.

4

Control transfer

Transfers start in Pending status, preserving approval control.

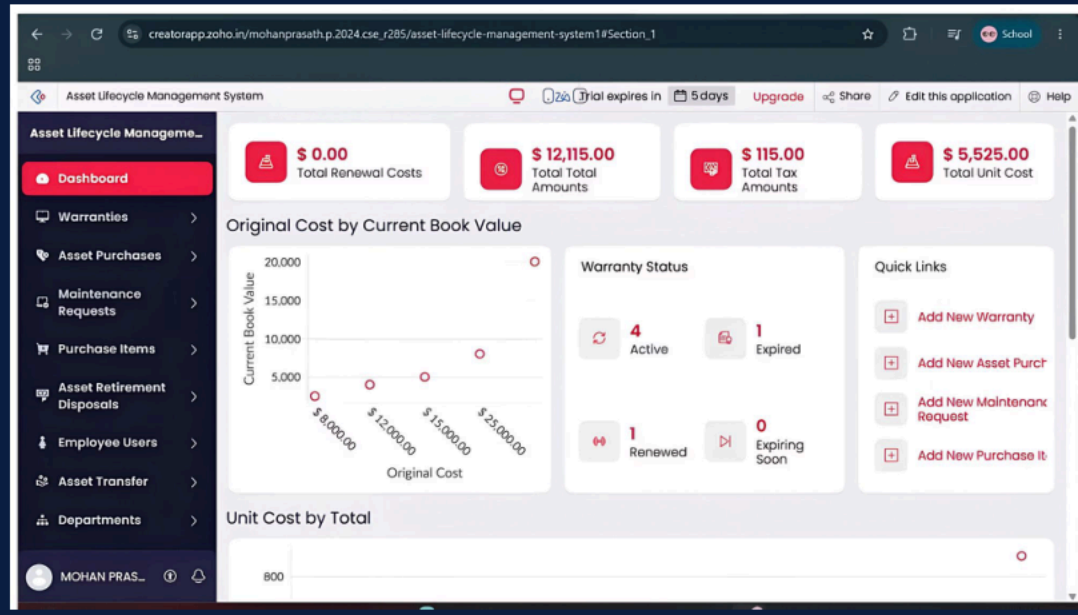

DAILY MONITORING

Warranty risk is monitored every day

A scheduled workflow classifies each non-renewed warranty as **Active**, **Expiring Soon** within 30 days, or **Expired**.

4 Active	**1** Expired
1 Renewed	**0** Expiring Soon

Management sees renewal exposure without manually reconciling dates.

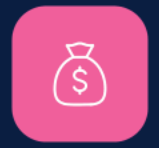

ACCESS BY ROLE

The application is built for different roles

Procurement

Purchases and vendor records.

Asset administration

Registration, assignment and transfers.

Maintenance

Faults, repairs and completion dates.

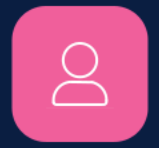

Department oversight

Visibility into assets and status.

Vendor access

Relevant service interactions.

Employee access

Assigned asset information.

7 profiles plus a CEO role separate access by responsibility. Portal users see only relevant modules. HTTPS, validation hooks and role hierarchy strengthen governance.

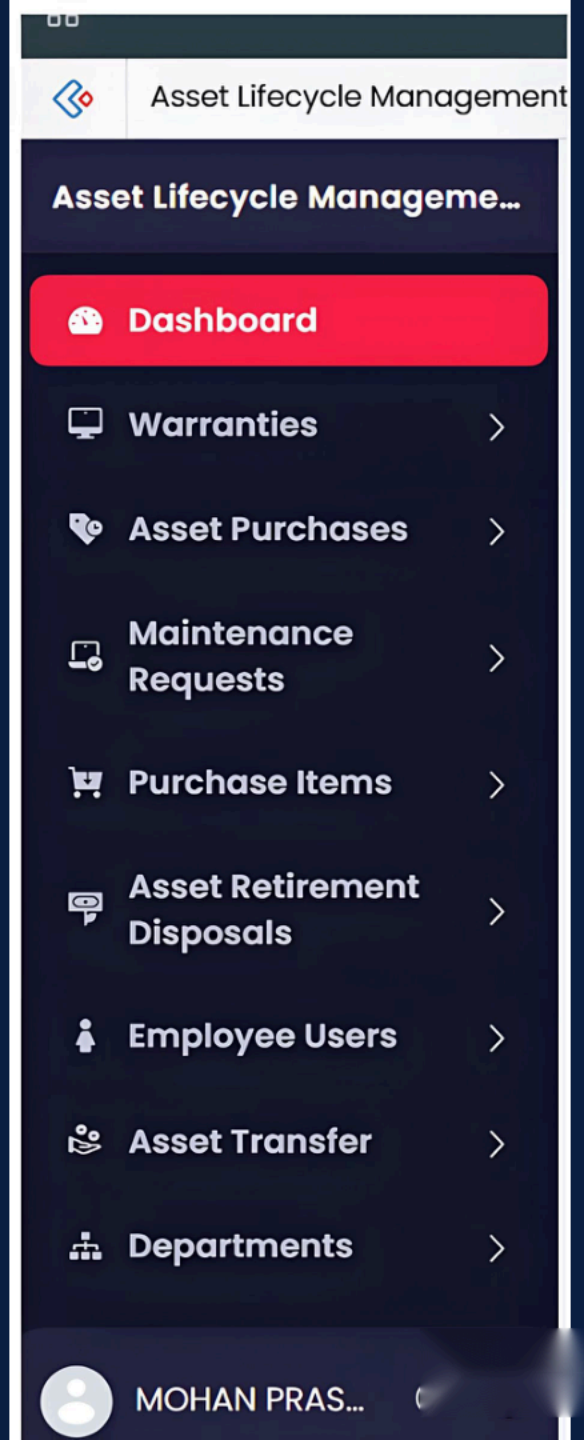

OPERATIONAL VIEW

Dashboards and reports make the system operational

20 reports — 11 list reports and 9 Kanban boards.

26 conditional-formatting rules highlight key statuses across 8 list reports.

Dashboard: 4 KPI cards, 2 scatter charts, warranty counters, quick links and an embedded report.

END-TO-END VALIDATION

Testing shows the core controls work end to end

1

12

test cases passed

Forms, notifications, validation, automation, RBAC and dashboard totals.

2

Purchase

The walkthrough begins with the purchase record.

3

Registration to maintenance

Registration, assignment and maintenance stay traceable.

4

Warranty monitoring

Two open observations remain: align the time zone to Asia/Kolkata and replace text links with lookups in a future release.

RESULT AND NEXT RELEASE

Better visibility.
A clear next release.

What exists now

One linked system replaces fragmented records with traceable lifecycle data.

Next enhancements

Automated purchase totals, status synchronisation, reminders, depreciation, QR-code audits and approval workflows.

Longer-term value

A reusable low-code pattern for institutional asset governance.
